

Data Visualization **EDU-BOOST**

The diagram features a central blue circle labeled "Python 3x Programming". To its left is a small green cartoon snake. To its right, three light blue circles are arranged vertically, connected by a blue line. The top circle is labeled "Lesson Python 3.x", the middle one "Tutor MR. Huynh Nam", and the bottom one "Time 90 mins".

- Python Data Type

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

2

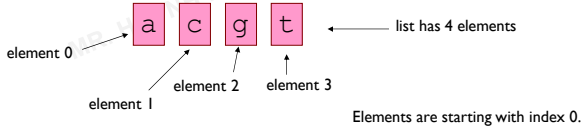

Data Visualization **EDU-BOOST**

Data type - Python List

- A list is created by placing all the items (elements) inside a square bracket `[]`, separated by commas.
- It can have any number of items and they may be of different types (integer, float, string etc.). Also, a list can even have another list as an item. This is called nested list.

```
nucleotides = ['a', 'c', 'g', 't']
print ("List of Nucleotides: ", nucleotides)
```

List of Nucleotides: ['a', 'c', 'g', 't']

The diagram shows a list with four elements: 'a', 'c', 'g', and 't', each in a pink box. Arrows point to each box with labels: "element 0" for 'a', "element 1" for 'c', "element 2" for 'g', and "element 3" for 't'. A line points to the entire row of boxes with the label "list has 4 elements". Below the boxes, it says "Elements are starting with index 0."

3

Data Visualization **EDU-BOOST**

Data type - Python List

- Access item by index
- 1 is index which is considered the last element in list
- Operators: + (combine), * (repeat) → result is a list
- Delete one or more items from a list using the keyword **del**. It can even delete the list entirely.

```
list_a = [1,2,3,4,5]
list_b = list_a * 2
print(list_b)

list_c = [6,7,8,9,10]
list_d = [11,12,13,14,15]
list_e = list_c + list_d
print(list_e)

my_list = ['p','r','o','b','l','e','m']
# delete one item
del my_list[2]
# Output: ['p', 'r', 'b', 'l', 'e', 'm']
print(my_list)
# delete multiple items
del my_list[1:5]
# Output: ['p', 'm']
print(my_list)
# delete entire list
del my_list
# Error: list not defined
print(my_list)
```

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

4

Data Visualization

Data type - Python List

• Methods: append, extend, insert, remove, pop, index, count, sort, reverse

```

x = ['a', 'c', 'g', 't']
i=2
print (x[0], x[i], x[-1])

x = ['a', 'c', 'b', 'd']
print ("x =",x)
x.sort()
print ("x =",x)
x.reverse()
print ("x =",x)

```

Diagram illustrating list operations:

- Initial list: `x = ['a', 'c', 'g', 't']`. Accessing `x[0]`, `x[2]`, and `x[-1]` results in the output `a g t`.
- After `sort()` and `reverse()`: `x = ['a', 'c', 'b', 'd']` becomes `x = a c b d`, then `x = a b c d`, and finally `x = d c b a`.

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

6

Data Visualization

Data type - Python Tuple

- A tuple is similar to a list. The difference between the two is that we **cannot change the elements of a tuple once it is assigned** whereas in a list, elements can be changed.
- A tuple is created by placing all the items (elements) inside a parentheses (), separated by comma. The parentheses are optional but is a good practice to write it.
- A tuple can have any number of items and they may be of different types (integer, float, list, string etc.).

```

t = (1, 2, 3, 4, 5)
my_tuple = 1,2,3,4,5
q = (1, 2, (3, 4), 5)

```

Diagram illustrating tuple creation and indexing:

- Example 1: `t = (1, 2, 3, 4, 5)` and `my_tuple = 1,2,3,4,5` are shown as equivalent tuple representations.
- Example 2: `q = (1, 2, (3, 4), 5)` shows a nested tuple.
- Example 3: `my_tuple = ('p','e','r','m','i','t')` with negative indexing:
 - `print(my_tuple[-1])` outputs: `'t'`
 - `print(my_tuple[-6])` outputs: `'p'`

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

7

Data Visualization

Data type - Python Tuple

- Concatenation (+): combine two tuples
- Repeat (*): repeat the elements in a tuple for a given number of times
- result is new tuple

```

tuple_a = (1,2,3,4,5)
tuple_b = (6,7,8,9,10)

tuple_c = tuple_a + tuple_b
print(tuple_c)

tuple_d = tuple_a * 2
print(tuple_d)

```

Diagram illustrating tuple operations:

- Concatenation: `tuple_a = (1,2,3,4,5)` and `tuple_b = (6,7,8,9,10)` combined into `tuple_c = (1,2,3,4,5,6,7,8,9,10)`.
- Repetition: `tuple_d = tuple_a * 2` results in `(1,2,3,4,5,1,2,3,4,5)`.

• Keyword "del": deleting a tuple entirely `del my_tuple`

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

8

Data Visualization

Data type - Python String

- A string is a sequence of characters.
- Single / double quotation mark or : ', "
- Combining string: +, +=
- Access characters and slice: []

```

str = 'programiz'
print(str)

#first character
print(str[0] = ' ', str[0])

#last character
print(str[-1] = ' ', str[-1])

#slicing 2nd to 5th character
print(str[1:5] = ' ', str[1:5])

#slicing 6th to 2nd last character
print(str[5:-2] = ' ', str[5:-2])

```

Diagram illustrating string operations:

- Concatenation: `a = "pan"` and `b = "cake"` combined into `pancake`.
- Combining: `a = "hello"` and `d = "world"` combined into `helloworld`.

- Get string length `x: len(x)`
- Strings are immutable. This means that **elements of a string** cannot be changed once it has been assigned. We can simply **reassign different strings** to the same name.
- Keyword "del": deleting a string entirely

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

Data Visualization EDU-BOOST

Data type - Python String

- Format string:
 - Some methods: upper, lower, split, replace ...

Formatted String

%

Insertion Tuple

```
>>> "aaaa%saasa%sa" % ("gcgcgc", "tttt")
'aaaagcgcgcgaattttaaa'
```

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

10

Data Visualization EDU-BOOST

Data type - Python String

Covert to upper-case

Convert to lower-case

Replace i with a

```
x = "A simple sentence"
print (x)
print (x.upper())
print (x.lower())
x = x.replace("i", "a")
print (x)
```

```
A simple sentence
A SIMPLE SENTENCE
a simple sentence
A sample sentence
```

Data Visualization EDU-BOOST

Data type - Python Sets

- A set is an **unordered** collection of items. Every element is unique (**no duplicates**) and must be immutable (which **cannot be changed**).
- However, the set itself is mutable. We can add or remove items from it.
- A set is created by placing all the items (elements) inside curly braces {}, separated by comma or by using the built-in function set().
- Cannot access or change an element of set using indexing or slicing.

```
# set of integers
my_set = {1, 2, 3}
print(my_set)

# set of mixed datatypes
my_set = {1.0, "Hello", (1, 2, 3)}
print(my_set)

# we can make set from a list
# Output: {1, 2, 3}
my_set = set([1,2,3,2])
print(my_set)

# set do not have duplicates
# Output: {1, 2, 3, 4}
my_set = {1,2,3,4,3,2}
print(my_set)
```

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

12

Data Visualization EDU-BOOST

Data type - Python Sets

- Add single element using the **add()** method and multiple elements using the **update()** method.
- The **update()** method can take tuples, lists, strings or other sets as its argument.

```
# initialize my_set
my_set = {1,3}
print(my_set)

# if you uncomment line 9,
# you will get an error
# TypeError: 'set' object does not support indexing
#my_set[0]

# add an element
# Output: {1, 2, 3}
my_set.add(2)
print(my_set)

# add multiple elements
# Output: {1, 2, 3, 4}
my_set.update([2,3,4])
print(my_set)

# add List and set
# Output: {1, 2, 3, 4, 5, 6, 8}
my_set.update([4,5], {1,6,8})
print(my_set)
```

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

13

Data Visualization

Data type - Python Sets

- Removed from set using methods, **discard()** and **remove()**.
- Using **discard()** if the item does not exist in the set, it remains unchanged. But **remove()** will raise an error in such condition.

```
# initialize my_set
my_set = {1, 3, 4, 5, 6}
print(my_set)

# discard an element
# Output: {1, 3, 5, 6}
my_set.discard(4)
print(my_set)

# remove an element
# Output: {1, 3, 5}
my_set.remove(6)
print(my_set)

# discard an element
# not present in my_set
# Output: {1, 3, 5}
my_set.discard(2)
print(my_set)

# remove an element
# not present in my_set
# If you uncomment line 27,
# you will get an error.
# Output: KeyError: 2
my_set.remove(2)
```

Data type - Python Sets

- Set Union: |

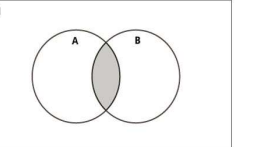

```
# initialize A and B
A = {1, 2, 3, 4, 5}
B = {4, 5, 6, 7, 8}

# use | operator
# Output: {1, 2, 3, 4, 5, 6, 7, 8}
print(A | B)

# use union function
>>> A.union(B)
{1, 2, 3, 4, 5, 6, 7, 8}

# use union function on B
>>> B.union(A)
{1, 2, 3, 4, 5, 6, 7, 8}
```

- Set Intersection: &

```
# initialize A and B
A = {1, 2, 3, 4, 5}
B = {4, 5, 6, 7, 8}

# use & operator
# Output: {4, 5}
print(A & B)

# use intersection function on A
>>> A.intersection(B)
{4, 5}

# use intersection function on B

Data Visualization

Data type - Python Sets

- Set Difference: -

```
# initialize A and B
A = {1, 2, 3, 4, 5}
B = {4, 5, 6, 7, 8}

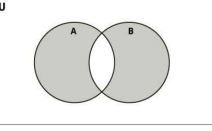

# use - operator on A
# Output: {1, 2, 3}
print(A - B)

# use difference function on A
>>> A.difference(B)
{1, 2, 3}

# use - operator on B
# Output: {6, 7, 8}
print(B - A)

# use difference function on B
>>> B.difference(A)
{6, 7, 8}
```

- Set Symmetric Difference: ^

```
# initialize A and B
A = {1, 2, 3, 4, 5}
B = {4, 5, 6, 7, 8}

# use ^ operator
# Output: {1, 2, 3, 6, 7, 8}
print(A ^ B)

# use symmetric difference function on A
>>> A.symmetric_difference(B)
{1, 2, 3, 6, 7, 8}

# use symmetric difference function on B
>>> B.symmetric_difference(A)
{1, 2, 3, 6, 7, 8}
```

Data Visualization

Data type - Python Dictionary

- Python dictionary is an unordered collection of items.
- A dictionary has a {**key: value**} pair
- Dictionaries are optimized to retrieve values when the key is known.
- Values can be of any data type and can repeat, keys must be of immutable type (string, number or tuple with immutable elements) and must be unique.
- Methods: keys, values, pop, items, has_key...

```
# empty dictionary
my_dict = {}

# dictionary with integer keys
my_dict = {1: 'apple', 2: 'ball'}

# dictionary with mixed keys
my_dict = {'name': 'John', 1: [2, 4, 3]}

# using dict()
my_dict = dict({'apple': 2, 'ball': 1})

# from sequence having each item as a pair
my_dict = dict([(1, 'apple'), (2, 'ball')])
```

- Accessing value by key with operator []

Read value: my_dict['name'] → #Output: 'John'

Assign value: my_dict['name'] = "Nam" → Output: 'Nam'

Using operator [] to look up value

Data Visualization **EDU-BOOST**

Data type – Python Nested Dictionary

- A nested dictionary is a dictionary inside a dictionary. It's a collection of dictionaries into one single dictionary.

```
nested_dict = { 'dictA': { 'key_1': 'value_1'},
                'dictB': { 'key_2': 'value_2'}}

people = {1: { 'name': 'John', 'age': '27', 'sex': 'Male'},
          2: { 'name': 'Marie', 'age': '22', 'sex': 'Female'}}
```

- Access the elements using the [] syntax

```
people = {1: { 'name': 'John', 'age': '27', 'sex': 'Male'},
          2: { 'name': 'Marie', 'age': '22', 'sex': 'Female'}}
```

John
27
Male

WRITTEN BY MR. HUYNH NAM www.giangdayit.com

19

Data Visualization **EDU-BOOST**

Data type – Python Nested Dictionary

- Example

```
people = {'person1': { 'name': 'John', 'age': '27', 'sex': 'Male'},
          'person2': { 'name': 'Marie', 'age': '22', 'sex': 'Female'},
          'person3': { 'name': 'Luna', 'age': '24', 'sex': 'Female'},
          'person4': { 'name': 'Peter', 'age': '29', 'sex': 'Male'}}

print(people['person1'])
print(people['person1']['name'])

people['person5'] = { 'name': 'Nam', 'age': '27', 'sex': 'Male'}

print(people['person5'])
print(people['person5']['name'])

people[1] = { 'name': 'Huynh', 'age': '27', 'sex': 'Male'}
print(people[1])
print(people[1]['name'])

people[2] = { 'ten': 'Quan', 'tuoi': '27'}
print(people[2])
print(people[2]['ten'])
```

What is result?

```
people = {'person1': { 'name': 'John', 'age': '27', 'sex': 'Male'},
          'person1': { 'name': 'Marie', 'age': '22', 'sex': 'Female'}}

print(people['person1'])
print(people['person1']['name'])
```

{ 'name': 'Marie', 'age': '22', 'sex': 'Female'}
Marie
